

EXPERIMENT 17:

17. Illustrate the deadlock avoidance concept by simulating Banker's algorithm with C program .

```
main.c
1 #include <stdio.h>
2 #include <stdbool.h>
3
4 #define P 5 // Number of processes
5 #define R 3 // Number of resource types
6
7 bool isSafe(int processes[], int avail[], int max[][R], int
    alloc[][R]) {
8     int need[P][R];
9     for (int i = 0; i < P; i++)
10         for (int j = 0; j < R; j++)
11             need[i][j] = max[i][j] - alloc[i][j];
12
13     bool finish[P] = {0};
14     int safeSeq[P];
15     int work[R];
16     for (int i = 0; i < R; i++) work[i] = avail[i];
17
18     int count = 0;
```

Output

System is in a SAFE STATE.
Safe sequence: P1 P3 P4 P0 P2

=== Code Execution Successful ===

PSEUDO CODE :

Algorithm Banker (Allocation, Max, Available, Need, n, m):

1. Compute $Need[i][j] = Max[i][j] - Allocation[i][j]$ for all i, j .
2. Initialize $Work = Available$ and $Finish[i] = false$ for $i = 0..n-1$.
3. Find an index i such that:
 - a. $Finish[i] == false$
 - b. $Need[i][j] \leq Work[j]$ for all resources $j = 0..m-1$
4. If such an i exists:
 - $Work[j] = Work[j] + Allocation[i][j]$
 - $Finish[i] = true$
 - Append i to $safeSequence$
 - Repeat Step 3.
5. If $Finish[i] == true$ for all i :
 - System is in a SAFE STATE.
 - Return $safeSequence$.
6. Else:
 - System is in an UNSAFE STATE (Deadlock risk).

CODE:

```
#include <stdio.h>

#include <stdbool.h>

#define P 5 // Number of processes
#define R 3 // Number of resource types

bool isSafe(int processes[], int avail[], int max[][R], int alloc[][R]) {
    int need[P][R];

    for (int i = 0; i < P; i++)
        for (int j = 0; j < R; j++)
            need[i][j] = max[i][j] - alloc[i][j];

    bool finish[P] = {0};
    int safeSeq[P];
    int work[R];
    for (int i = 0; i < R; i++) work[i] = avail[i];

    int count = 0;
    while (count < P) {
        bool found = false;
        for (int p = 0; p < P; p++) {
            if (!finish[p]) {
                int j;
```

```

        for (j = 0; j < R; j++)
            if (need[p][j] > work[j]) break;

        if (j == R) {
            for (int k = 0; k < R; k++) work[k] += alloc[p][k];
            safeSeq[count++] = p;
            finish[p] = true;
            found = true;
        }
    }
}

if (!found) {
    printf("System is NOT in a safe state.\n");
    return false;
}

printf("System is in a SAFE STATE.\nSafe sequence: ");
for (int i = 0; i < P; i++) printf("P%d ", safeSeq[i]);
printf("\n");
return true;
}

int main() {
    int processes[] = {0, 1, 2, 3, 4};

```

```
int avail[] = {3, 3, 2};

int max[P][R] = {{7, 5, 3}, {3, 2, 2}, {9, 0, 2}, {2, 2, 2}, {4, 3, 3}};

int alloc[P][R] = {{0, 1, 0}, {2, 0, 0}, {3, 0, 2}, {2, 1, 1}, {0, 0, 2}};

isSafe(processes, avail, max, alloc);

return 0;

}
```
